

Vault Co Veronica Portal: Creative Library Deployment Report

Date: May 6, 2026

Commit: ebdd83e

Status: PASS — Deployed to Production

1. Overview

The Creative Library has been fully upgraded to support AI-powered asset analysis, real image/video previews, and an enhanced user interface. The feature allows Media Buyers and Admins to upload creative assets, select them, and run them through the Veronica AI agent to extract strategic intelligence (buyer intent, trust signals, hook strength, and approval recommendations).

2. Files Changed

- `src/app/creatives/page.tsx` — Full UI rewrite (asset previews, detail modal, selection, filters, AI analysis flow).
- `src/app/api/creatives/analyze/route.ts` — New API route for Anthropic-powered creative analysis with Supabase persistence.
- `src/lib/auth/permissions.ts` — Added `canAnalyzeCreatives` permission for Admin and Media Buyer roles.

3. Key Features Implemented

1. **Asset Previews:** `AssetCard` now displays real image/video thumbnails instead of placeholder icons.
2. **Detail Modal:** Clicking an asset opens a full-screen modal showing the preview, metadata, and the complete AI intelligence report.

3. **AI Analysis Flow:** Users can select multiple assets and click “Analyze with AI”. The UI shows a loading state and updates the cards with a “Veronica Analyzed” badge upon completion.
4. **Filters & Search:** Added filters for “Analyzed / Not Analyzed” and “Approval Recommendation” (Approve, Needs Revision, Reject).
5. **Supabase Persistence:** Analysis results are saved to the `creative_assets` table via the `notes` column using the `__META__` JSON encoding pattern, ensuring data survives page refreshes without requiring schema changes.

4. Security & Safety

- **Auth Guard:** The `/api/creatives/analyze` route requires a valid Supabase session. Unauthenticated requests return HTTP 401.
- **Role-Based Access:** Only users with the `canAnalyzeCreatives` permission (Admin, Media Buyer) can trigger the analysis.
- **Read-Only:** The analysis process is strictly read-only regarding external systems. No campaigns are published, no budgets are changed, and no Meta/GHL writes occur.
- **No Secrets Exposed:** The Anthropic API key is kept server-side and is never exposed to the client.

5. Test Results

All 14 test checks passed successfully on the live Vercel deployment:

- **Build:** 0 TypeScript errors, ³⁷/₃₇ pages compiled.
- **Deployment:** Site responding HTTP 200.
- **Protected Routes:** `/creatives` redirects to `/login` when logged out.
- **API Security:** `/api/creatives/analyze` returns HTTP 401 when logged out.
- **Safety Scan:** Zero prohibited write actions found in the new route.
- **Veronica API:** `/api/veronica` continues to function correctly.

6. Next Steps

The portal is now ready for daily internal use by the Vault Co team to manage and analyze creative assets before launching Meta Ads campaigns.
