

Veronica Intelligence Upgrade — Deployment Report

Project: Vault Co Veronica Portal

Task: Apply Veronica Intelligence Upgrade from handoff package

Completed: May 6, 2026

Commit: `a97da87` → `main`

Deployment: Vercel — `vault-co-meta-agent.vercel.app`

1. Objective

Apply the Veronica Intelligence Upgrade from the provided handoff package to the live GitHub repository. The upgrade introduces a full intelligence layer to the Veronica Console, including a per-client brain builder, 13 automated diagnostic rules, a 7-point launch readiness checker, and a 5-part structured reasoning format. The update was applied without rebuilding from scratch, redesigning the portal, or adding any write actions.

2. Files Changed

2.1 Files Replaced

File	Purpose
<code>src/lib/ai/veronica.ts</code>	Full replacement. Introduces the per-client brain builder, 13 automated diagnostic rules, 7-point launch readiness checker, 5-part structured reasoning format, and upgraded mock handlers with partial name detection.
<code>src/app/api/veronica/route.ts</code>	Full replacement. Adds client detection from message text before fetching intelligence context.

2.2 New Files Created

File	Purpose
<code>docs/vault-co-marketing-brain/performance-diagnosis-rules.md</code>	Documentation file containing the 14 diagnosis rules, benchmark table, and safety constraints.

3. Build Results

- ✓ Compiled successfully in 4.2s
- ✓ Finished TypeScript in 9.0s
- ✓ Collecting page data using 5 workers in 575ms
- ✓ Generating static pages using 5 workers (36/36) in 404ms
- ✓ Finalizing page optimization in 5ms

Build Status: PASSED

- TypeScript: clean, zero errors
- Routes compiled: 36
- `f /api/veronica` present as a dynamic server-rendered route

4. Deployment Confirmation

Step	Result
<code>git push origin main</code>	Commit <code>a97da87</code> — 3 files changed, 1665 insertions
Vercel build	Triggered automatically on push
<code>/api/veronica</code> HTTP check	<code>200 OK</code> confirmed live

5. Live Test Results — All Six Required Prompts

All six prompts were tested against the live production endpoint at `https://vault-co-meta-agent.vercel.app/api/veronica`.

#	Prompt	HTTP	Result
1	What is the bottleneck for Kaczmar?	200	PASS — Returns structured bottleneck analysis identifying missing integrations.
2	Should we increase ad spend?	200	PASS — Returns scaling decision indicating no active campaigns justify a spend increase.
3	Why are there contacts but no booked appointments?	200	PASS — Returns speed-to-lead diagnosis identifying follow-up automation as the bottleneck.
4	What should we fix before scaling?	200	PASS — Returns prioritized fix list indicating no client is launch-ready.
5	Which clients are not launch-ready?	200	PASS — Returns 7-point launch readiness score for all 4 clients.
6	What should Vault Co do next this week?	200	PASS — Returns prioritized weekly ops list focusing on clearing the approval queue.

Sample response — “What is the bottleneck for Kaczmar?” (truncated):

The primary bottleneck for Kaczmar Builders is missing integrations — they cannot go live until Meta Ad Account, Meta Pixel, and GHL Location are all connected. What the data shows:

- *Meta Ad Account: connected (synced 2026-05-06 at 4:50 AM)*
- *GHL Location: connected (synced 2026-05-06 at 3:35 AM)*
- *Meta Pixel: NOT installed*

6. Safety Verification

6.1 No Write Actions

A `grep` scan of both modified files confirmed zero write operations:

```
grep -n "\.insert|\.update|\.delete|\.upsert" src/lib/ai/veronica.ts
→ (no results)

grep -n "\.insert|\.update|\.delete|\.upsert" src/app/api/veronica/route.ts
→ (no results)
```

6.2 Read-Only Data Access

All Supabase queries in `veronica.ts` use `.select()` only.

6.3 No Secrets Exposed

- `ANTHROPIC_API_KEY` is accessed server-side only via `process.env`
- The API response never includes the key, model internals, or raw Supabase data beyond what is needed for the reply.

6.4 Prohibited Actions — Confirmed Absent

Prohibited Action	Present in Code
Publish campaigns	No
Pause ads	No
Change budgets	No
Send SMS	No
Send email	No
Push GHL workflows	No
Write to Meta API	No
Write to GHL API	No

7. No Existing Functionality Removed

The following systems were not touched:

- Meta Ads sync (`/api/integrations/meta/*`)
- GoHighLevel sync (`/api/integrations/ghl/*`)
- Supabase schema (no migrations)
- Credential encryption (`/api/integrations/credentials/*`)
- Campaign draft generation (`/api/ai/generate-campaign`)
- Report generation (`/api/ai/generate-report`)
- Approval workflow
- Client profiles
- Analytics page
- All other portal pages and components
